Introduction

Tutorial principles.

- You want to learn something.
- I am trying to create space for it.
- That's why the highest priority is what **you** need:
 - ... understand something from the lecture
 - ... understand a task from the previous tutorial
 - ... understand some homework assignment, etc.
- Don't be afraid to ask questions
- A few general **tips**:
 - When you feel lost, try to play with examples. (E.g., if you can't solve a task for general n, k, try what it says for small values. Don't know what an algorithm does? Try it on small input.)
 - Try to explain where you got stuck to your classmates. It will help you understand what's really going on, get your thinking clearer.
 - If you still don't know, reach out, I will try to help.

Logistical details.

- Email me at koutecky+ads1@iuuk.mff.cuni.cz.
- The tutorial website is at http://research.koutecky.name/db/teaching:ads12122_tutorial
- You need to get 100 points to gain credit. Points are awarded for:
 - Homework. There will be a batch of tasks every other week. The total amount of points obtainable will be at least 150. You need to solve at least one task from each batch, not necessarily within the deadline.
 - Correcting each other's homework. If you are confident about your solution, you can email me and say you want to be a student grader; if your solution is indeed correct, I will let you correct the other solutions and gain extra points for it.
 - A small project.
 - I don't require attendance. If you feel that you can benefit more from self-study or anything else, go
 for it.
- Tasks are handed in the OWL system: https://kam.mff.cuni.cz/owl/
- We can discuss over OWL.
- If you need further help, try getting it from your classmates. If there's more of you who need help with the same thing, email me and we'll set up a meeting:)

Algorithms. A newspaper tasks a reporter to write an article on the working conditions of a certain company. Thus, he has to try as many positions in this company as possible. However, he would like his salary to keep increasing. The company posts advertisements for various positions at certain times. Mathematically speaking, we are given a sequence p_1, \ldots, p_n of positive real numbers, and we are looking for a longest strictly increasing subsequence.

How can we solve this problem:

- a) According to the definition
- b) Recursively

c) Recursively with memoization

- d) As a graph problem
- e) With a clever data structure

Complexity.

- What do we neglect and why?
- What does it mean in words: O(n), $\Omega(n)$, o(n), o(n)? How to write it formally (with quantifiers, as a formula / logical expression)?

Asymptotics. Find as many as possible asymptotic relationships between the following functions: n, $\log n$, $\log \log n$, \sqrt{n} , $n^{\log n}$, 2^n , 3^n , $n^{3/2}$, n!, n^n .

 \mathcal{O} -sum. Let f_1, f_2 be functions s.t. $f_1 \in \mathcal{O}(f_2)$. Prove that $f_1 + f_2 \in \mathcal{O}(f_2)$.

 \mathcal{O} -max. Prove that $\mathcal{O}(f+g) = \mathcal{O}(\max\{f,g\})$.

Other tasks... These tasks are from projecteuler.net, which I recommend if you want to practically learn to the art of algorithms (and perhaps also learn a new programming language in the process).

Powers of 3 and 5. How to write the n-th number of the form $3^{i}5^{j}$ as quickly as possible?

Longest Collatz. Let us introduce a simple rule which, for any natural number n, assigns another number, yielding a kind of chain:

 $n \to n/2$ if n is even, $n \to 3n+1$ if n is odd.

Starting with n = 13, we get the following chain:

 $13 \rightarrow 40 \rightarrow 20 \rightarrow 10 \rightarrow 5 \rightarrow 16 \rightarrow 8 \rightarrow 4 \rightarrow 2 \rightarrow 1$

(The so-called *Collatz Conjecture* states that if we start from any $n \in \mathbb{N}$, we will eventually arrive in 1. So far, no one was able to prove or disprove this.)

How to quickly find which number $n \leq 1000,000$ produces the longest chain before reaching 1?
